UNION SPECIAL CORPORATION

INDUSTRIAL SEWING MACHINES

Printed in U.S.A.

Reprinted 9/92

IDENTIFICATION OF MACHINES

Each UNION SPECIAL machine is identified by a Style number which is stamped into the name plate on the machine. Style numbers are classified as standard and special. Standard Style numbers have one or more letters suffixed, but never contain the letter "Z". Example: "Style 52700 BK". Special Style numbers contain the letter "Z". When only minor changes are made in a standard machine, a "Z" is suffixed to the standard Style number. Example: "Style 52700 BKZ".

The over-all width of the stitch or the distance between the outside needles (extreme left and right) is represented by a gauge number. The actual spacing between the center lines of the outside needles, as applied to these machines, is as follows: No. 8 gauge .125", No. 12 gauge .172" and No. 16 gauge .234".

Styles of machines similar in construction are grouped under a class number which differs from the style number in that it contains no letters. Example: "52700".

APPLICATION OF CATALOG

This catalog applies specifically to the standard Styles of machines as listed herein. It can also be applied with discretion to some Special Styles of machines in this class. Reference to direction, such as right, left, front, back, etc., are given from the operator's position while seated at the machine. Operating direction of handwheel is toward the operator.

STYLES OF MACHINES IN CLASS 52700

High Speed Streamlined Flat Bed Medium Throw Machine, Two and Three Needles Abreast, Double Disc Take-up, One Looper, Needle Bearing Needle Bar Drive, Light Weight Presser Bar and Needle Bar Driving Mechanism, Single Reservoir Enclosed Automatic Lubricating System, Filter Type Oil Return Pump, Oil Pump Base Plate and Oil Siphon Assembly. Lateral Looper Travel, Work Space to Right of Needle Bar 7 3/4 Inches.

- 52700 BK Two Needle, Plain Feed Machine, for making belt loops for trousers, overalls, bathrobes, and for similar operations on medium to medium heavy weight materials. Strips used in short lengths. Belt loops are 3/32 inch wider than needle spacing of machine. Standard gauges Nos. 12 and 16. Seam specification 406-EFh-1. Type 128 GAS needle.
- 52700 BL Two Needle, Plain Feed Machine, for hemming sides and bottoms of bathrobes, and for similar operations on medium to medium heavy weight woven fabrics. Standard gauges Nos. 12 and 16. Seam specification 406-EFa-1. Type 126 GS needle.
- 52700 BM Three Needle, Plain Feed Machine, for attaching elastic bands in long lengths, garment lengths or with ends joined, to rayon, silk, cotton, nylon and wool, flat, warp and ribbed knit garments, and for similar operations on light to medium weight material. Automatic stretching device and spool holder for elastic. Standard gauge No. 16 only. Seam specification 407-LSb-1 inverted. Type 121 GBS needle.
- 52700 BN Two Needle, Plain Feed Machine, for attaching elastic bands in long lengths, garment lengths, or with ends joined, to rayon, silk, cotton, nylon and wool, flat, warp and ribbed knit garments, and for similar operations on light to medium weight material. Automatic stretching device and spool holder for elastic. Standard gauges Nos. 8, 12 and 16. Seam specification 406-LSb-1 inverted. Type 121 GS needle.

STYLES OF MACHINES IN CLASS 52700 (continued)

- 52700 BP Two Needle, Plain Feed Machine, for attaching elastic in long lengths, 3/8 to 1 1/4 inches wide, to rayon, silk, cotton, nylon and wool, flat, warp and ribbed knit garments, and for similar operations on light to medium weight materials. Equipped with elastic metering device. Seam Specification 406-LSb-1 inverted. Type 121 GS needle.
- 52700 BR Two Needle, Plain Feed Machine with under trimmer, for attaching elastic bands in long lengths, 1/4 to 1 1/2 inches wide, to rayon, silk, cotton, nylon and wool, flat, warp and ribbed knit garments, and for similar operations on light to medium weight material. Standard gauges Nos. 8 and 12. Seam specification 406-LSa-1. Type 121 GBS needle.
- 52700 BS Three Needle, Plain Feed Machine with under trimmer, for attaching elastic bands in long lengths, 3/8 to 1 1/2 inches wide, to rayon, silk, cotton, nylon and wool, flat, warp and ribbed knit garments, and for similar operations on light to medium weight material. Standard gauge No. 16 only. Seam specification 407-LSa-1. Type 121 GBS needle.
- 52700 BT Same as 52700 BR, except fitted with thumbscrew adjusted differential feed. Furnished only in No. 8 gauge. Type 121 GBS needle.
- 52700 BU Same as 52700 BS, except fitted with thumbscrew adjusted differential feed. Type 121 GBS needle.
- 52700 BV Same as 52700 BR, except without under trimmer, but fitted with body folder for turning body of garment upwardly. Furnished only in No. 12 gauge. Seam specification 406-LSb-1. Type 121 GBS needle.

NEEDLES

Each UNION SPECIAL needle has both a type number and a size number. The type number denotes the kind of shank, point, length, groove, finish and other details. The size number, stamped on the needle shank, denotes the largest diameter of blade measured in thousandths of an inch, midway between the shank and the eye. Collectively, the type number and the size number is the complete symbol.

The type numbers of the needles recommended for each style of machine covered by this catalog are given in the machine style description. Other needles are available, but the ones indicated are those recommended to produce the most satisfactory results. The type numbers of the recommended needles, together with their descriptions and the sizes available, are listed below:

| Type No. | Description and Sizes |
|----------|--|
| 121 GS | Round shank, round point, short, double groove, struck groove, chromium plated - available in sizes 065/025, 070/027, 075/029, 080/032, 090/036, 100/040, 110/044, 125/049, 140/054. |
| 121 GBS | Round shank, round point, short, single groove, struck groove, spotted, ball point, chromium plated – available in sizes 065/025. 070/027, 075/029, 080/032, 090/036, 100/040. |
| 126 GS | Round shank, round point, short, double groove, struck groove, ball eye, chromium plated – available in sizes 080/032, 100/040, 054. |
| 128 GAS | Round shank, round point, short, double groove, struck groove, ball eye, spotted, chromium plated – available in sizes 080/032, 090/036, 100/040, 110/044, 125/049, 140/054, 060, 067. |

To have needle orders promptly and accurately filled, a sample needle, the empty package, or the type and size number should be forwarded. Use description on label. A complete order would read as follows: "1000 Needles, Type 121 GBS, Size 070/027".

NEEDLES (continued)

Selection of proper needle size should be determined by the size of the thread used. Thread should pass freely through the needle eye in order to produce a good stitch formation.

ORDERING REPAIR PARTS

ILLUSTRATIONS

This catalog has been arranged to simplify ordering repair parts. Exploded views of various sections of the mechanism are shown so that the parts may be seen in their actual position in the machine. On the page opposite the illustration will be found a listing of the parts with their part numbers, descriptions, and the number of pieces required in the particular view being shown.

Numbers in the first column are reference numbers only, and merely indicate the position of that part in the illustration. Reference numbers should never be used in ordering parts. Always use the part number listed in the second column.

Component parts of sub-assemblies, which can be furnished for repairs, are indicated by indenting their descriptions under the description of the main subassembly. Example:

| 10 | 29476 LE | Looper Driving Lever Crank Assembly | |
|----|----------|-------------------------------------|---|
| 11 | 22587 | Screw, upper | 2 |
| 12 | 22729 D | Screw | _ |
| 13 | 51243 C | Ball Stud Guide | 1 |
| 14 | 22559 A | Screw, lower | 2 |

It will be noted in the above example that the eccentric and bearing are not listed. The reason is that replacement of these parts individually is not recommended, so the complete sub-assembly should be ordered.

In those cases where a part is common to all of the machines covered by this catalog, no specific usage will be mentioned in the description. However, when the parts for the various machines are not the same, the specific usage will be mentioned in the description, and if necessary, the difference will be shown in the illustration.

At the back of the book will be found a numerical index of all the parts shown in this book. This will facilitate locating the illustration and description when only the part number is known.

IDENTIFYING PARTS

Where the construction permits, each part is stamped with its part number. On some of the smaller parts, and on those where the construction does not permit, an identification letter is stamped in to distinguish the part from similar ones.

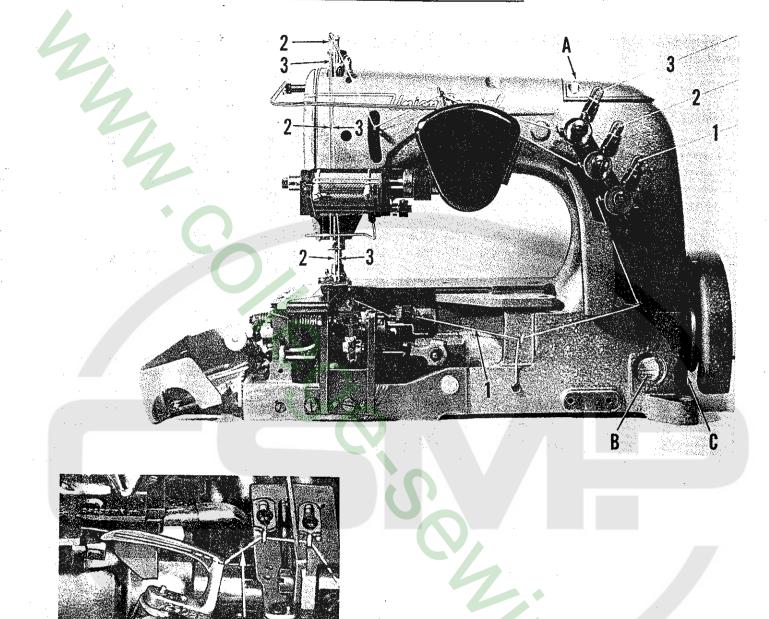

Part numbers represent the same part, regardless of the catalog in which they appear.

IMPORTANT! ON ALL ORDERS, PLEASE INCLUDE PART NAME AND STYLE OF MACHINE FOR WHICH PART IS ORDERED.

TERMS

Prices are net cash and are subject to change without notice. All shipments are forwarded f.o.b. shipping point. Parcel Post shipments are insured unless otherwise directed. A charge is made to cover postage and insurance.

OILING AND THREADING DIAGRAM

The oil has been drained from the machine before shipping, and the reservoir must be filled before beginning to operate. Use a straight mineral oil with a Saybolt viscosity of 90 to 125 seconds at 100° Fahrenheit.

Oil is filled at the spring cap "A" in the top cover, and the level is checked at the sight gauge "B" on the front of the machine. The oil level should be maintained between the red lines on the gauge. The capacity of the oil reservoir is 12 ounces.

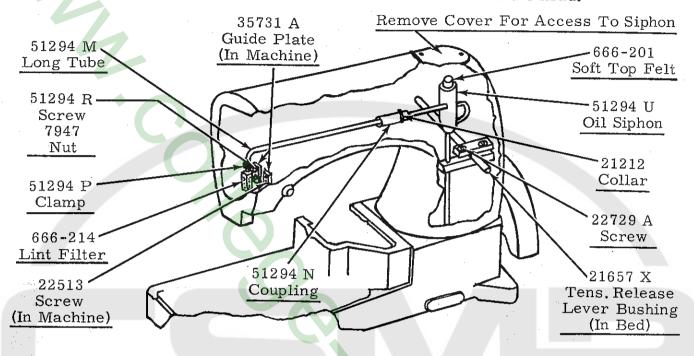

The machine is automatically lubricated, and no oiling, other than keeping the main reservoir filled, is necessary.

A daily check before the morning start should be made, and oil added if required. Oil which has gone through the machine is filtered and pumped back into the main reservoir, making too frequent oilings unnecessary. Excessive oil in the main reservoir may be drained at the plug screw "C" in the main frame directly under the handwheel.

Above are pictures showing the manner in which the 52700 Styles covered in this catalog are threaded. The three needle machines are threaded in substantially the same manner. The looper threading has been enlarged for clarity.

SELF-PRIMING HEAD OIL SIPHON

Class 52700 machines are equipped with a self-priming head oil siphon. When the machine is started, oil splashes on the priming cup felts, filters through the felts, and trickles down the vertical oil tube, thus, priming the siphon. Once the prime is established, it is maintained, unless the felts are removed. The siphon operates twenty-four hours a day, removing oil at the rate of six to twelve drops per minute, which of course, far exceeds the rate at which oil collects in the head.

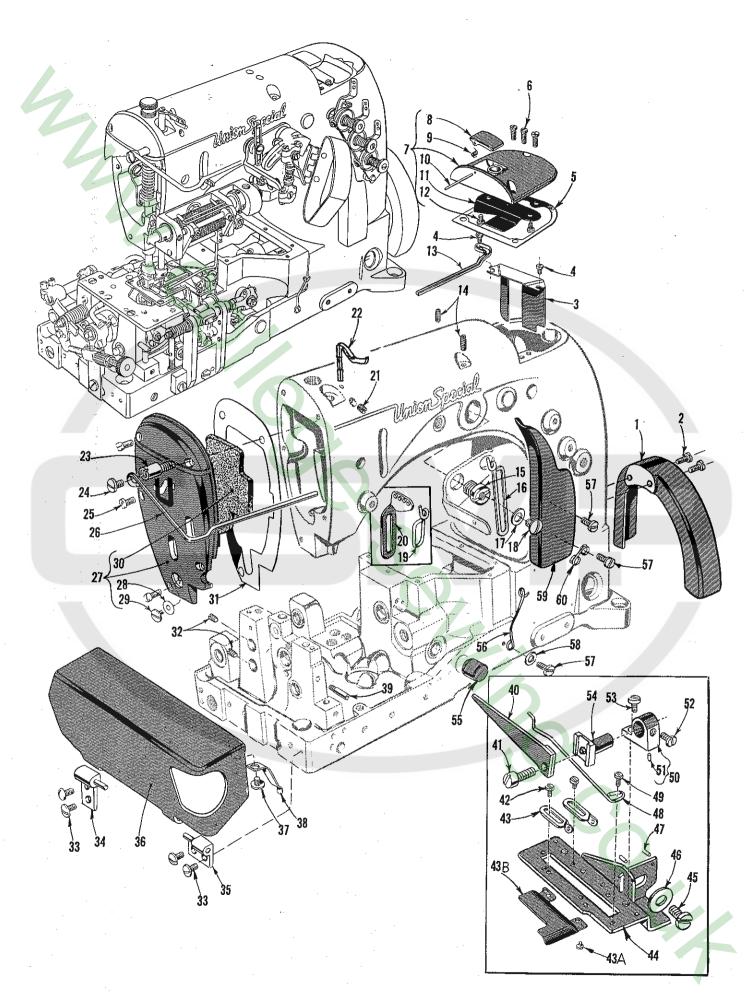

INSTALLING AND MAINTENANCE OF OIL SIPHON

A newly installed siphon starts its action within three to five minutes after the machine is operating. However, it may be twenty minutes or so before all the air is removed from the line and the siphon is in full operation. Within an hour, there is a distinct drop in oil level in the head sump.

The felts in the priming cup are designed for a specific purpose. The bottom felt, 666-209, is thin and relatively dense, to meter the flow of priming oil and to prevent the entrance of air. The softer top felt, 666-201, is a filter to prevent the clogging of the metering felt. This felt, at the intake of the siphon, keeps the siphon clear of lint, and prevents the entrance of air at that point. For the best initial self-priming condition, the felts of the siphon should be dry. In this condition, it is difficult for air to be trapped between the felts or in the top soft felt itself.

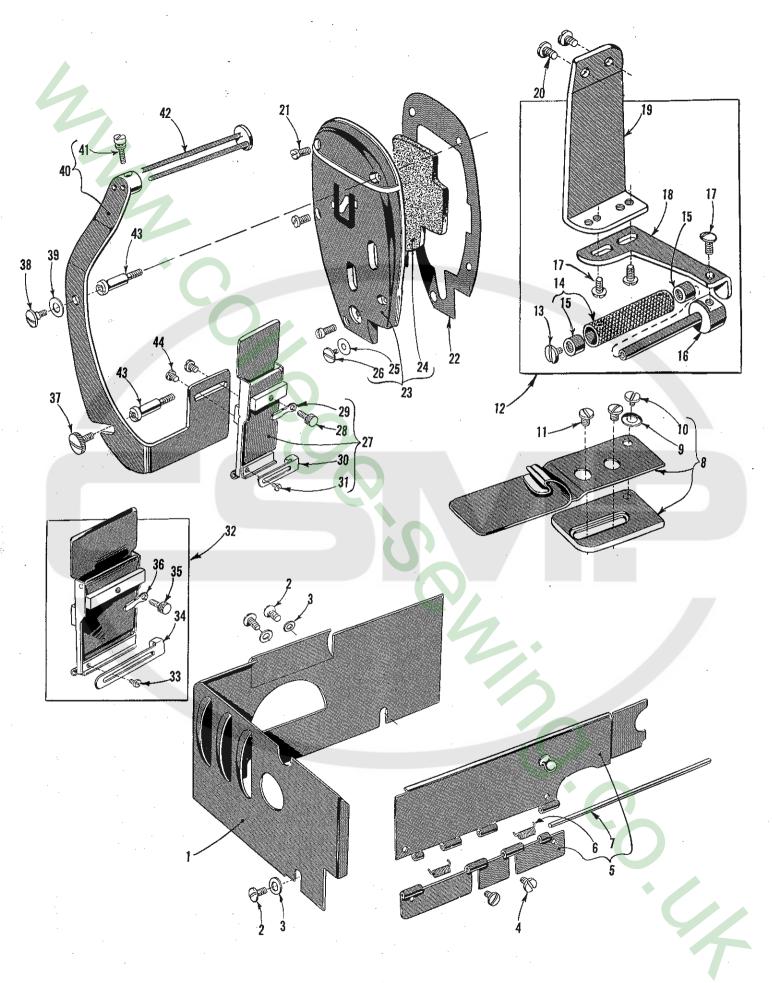

However, if for some reason the priming cup felts had been oiled before installing, the siphon may fail because air is trapped between the felts or in the soft top felt. As a precaution, remove the soft felt from the cup. Then, while squeezing the felt between the fingers, saturate it well with oil. In other words, squeeze out the air and replace it with oil. Then, completely fill the cup with oil, and push or twist the soft felt down into cup so that it definitely contacts the harder thin felt. This precaution prevents the trapping of air, and no trouble should be experienced when starting the siphon.

If you want to be doubly sure that the siphon is functioning correctly, on a machine in operation, apply a certain amount of oil in the sump around the felt in the head. Before doing this, be certain that this felt has been saturated in the same manner as explained for the soft felt in the top of the siphon cup. When this is done, the siphoning action will begin, and the oil will be removed as explained.

Here are Oil Specifications for Union Special Sewing Machines

Specification 174 specifies a high quality petroleum oil, viscosity 100 seconds at 100°F. Recommended for all oiling applications on high speed machines.

Specification 175 specifies a high quality petroleum oil, viscosity 100 seconds at 100°F., water white or with a maximum A.S.T.M. color number of 1. For use where freedom from oil staining is paramount.

Specification 87 specifies a high quality petroleum oil, viscosity 300 seconds at 100°F.

Specification 100 specifies a general purpose high quality grease for use in ball bearings and transmitters. It is similar to commercial N.L.G.I., grease No. 3. Where No. 3 grease is not obtainable, No. 2 may be used.

UNION SPECIAL

NOTE 1: The use of non-corrosive additives in oils meeting above classification is desirable but not essential. These may include:

- 1. Oxidation inhibitors
- 2. Rust inhibitors
- 3. Lubricity additives
- 4. Anti-oxidants
- 5. Film strength additives

These additives must be completely soluble in the oil and not removable by wick feeding nor shall they separate.

NOTE 2: Oils containing the following type additives shall not be used at any time:

- 1. Extreme pressure additives—corrosive
- 2. Tackiness or adhesive additives
- 3. Lead soap additives
- 4. Detergents

UNION SPECIAL CORPORATION

HERE ARE HELPFUL BULLETINS and CATALOGS TO HELP YOU SOLVE SEWING PROBLEMS

Union Special Wants to Help You Cut Sewing Machine Maintenance Costs

Union Special is offering two practical systems to help pinpoint and reduce your sewing machine maintenance costs: a record keeping system to help spot machines requiring abnormally high maintenance, and a parts inventory system to speed routine repairs.

Machine Maintenance Records

Repair-prone machines or inexperienced competent operators can eat up your maintenance dollars in short order. To help spot these problems, Union Special suggests two variations of a simple maintenance record keeping system using cards provided by Union Special.

The first system utilizes a "Machine Maintenance Record" card (Form 237) for each sewing machine in a plant. When a repair is required, the card is pulled from the file and the repair date, parts used, and their cost are entered in the spaces provided and the card is refiled.

The second system is normally used when more detailed information on repair costs is desired. Two record cards are used: a "Repair Request Card" (Form 234), and a "Machine Repair Record" (Form 233). When a machine requires service, the forelady or foreman fills out the top of a "Repair Request Card" and gives it to a mechanic. He fills in the time the repair work is started, the parts used and their cost,

Union Special

and the completion time. This data is then transferred to the permanent "Machine Repair Record" kept in the office.

Whichever system is used, management now has an invaluable tool to reduce needless maintenance costs.

Repair Part Inventories

While record keeping tells management which machines require abnormally high maintenance, it does little to help reduce the downtime caused by routine repairs. To alleviate this situation, Union Special recommends that manufacturers establish a formal parts inventory system for each type of sewing machine they operate.

Excessive machine downtime and wasted hours by mechanics can be eliminated with an orderly in-plant inventory of the most commonly needed parts. There is no longer a need to cannibalize other machines for spare parts. Long waits for deliveries are avoided and machine downtime is kept to a minimum. The cost of a parts inventory is small when the overall savings are considered.

For free sample copies of the machine record cards and spare part inventory lists for a variety of the most popular machines, contact your local Union Special Representative or write direct to Union Special.
